## Why Guess?

### FUSION SMART GUARD

From Logic RC comes this simple looking device that can quickly and accurately measure exactly what capacity remains in any battery you care to point at it without the need for a power supply, so there's no need to dig your charger out just to check through some batteries!

With a side port for LiPo connections from 2S up to 7S and a radio plug for 4 to 7 NiMH/NiCad receiver packs, it will tell you not only what capacity remains stored within, but in the case of LiPo cells it will list the individual LiPo cell voltages and the difference between the best and worst cell so you have a measure of the balance condition, instantly.

Within minutes I had been through my box of receiver packs and knew exactly which ones needed charging, and exactly which was charged enough to put straight into my nitro car, without finding out the hard way as it runs away with a failing receiver signal.

The Logic RC 'Smart Guard' is a must have for every pit box, I certainly won't be leaving home without it.

You can view the product range at [www.LogicRC.com](http://www.LogicRC.com)
